Introduction	ix
I Some variants of P systems and their computational power	9
1 Formal language theoretic prerequisites	11
1.1 Alphabets, strings and languages	11
1.1.1 Definitions	11
1.1.2 Operations with strings and languages	12
1.2 Multisets	13
1.3 Chomsky grammars	14
1.3.1 Definitions	14
1.3.2 Normal forms	15
1.4 Matrix grammars	16
1.4.1 Definitions	16
1.4.2 Normal forms	17
1.5 Lindenmayer systems	18
1.5.1 Definitions	18
1.5.2 Normal forms	19
1.6 Parallel rewriting	20
1.6.1 Grammars with partial parallelism	20
1.6.2 Parallel rewriting methods	21
1.7 Automata	23
1.7.1 Finite automata	23
1.7.2 Turing machines	25
1.8 Elements of complexity	27
2 Membrane systems	31
2.1 Definitions	32
2.2 Examples	40
2.3 The power of transition P systems	44
2.3.1 Transition P systems with internal output	44

2.3.2	Transition P systems with external output	46
2.3.3	Decidability results	46
2.4	Rewriting P systems	47
2.4.1	Definition	47
2.4.2	The computational power	49
2.5	Parallel rewriting P systems	50
2.5.1	Definitions	50
2.5.2	The computational power	51
2.6	Splicing P systems	53
2.6.1	Definitions	53
2.6.2	The computational power	55
3	P Systems with gemmation of mobile membranes	59
3.1	Definition	60
3.2	Examples	66
3.3	The computational power	68
3.3.1	Computational completeness	68
3.3.2	Collapsing hierarchies	73
3.3.3	The power of gemmation	77
3.4	Solving the Hamiltonian Path Problem in quadratic time	81
3.5	Remarks and open problems	86
4	Parallel rewriting P systems with deadlock	87
4.1	Definition	88
4.2	An investigation of deadlock conditions	92
4.3	The computational power	93
4.3.1	Relations with Lindenmayer systems and matrix gram- mars	93
4.3.2	Relation between P systems with deadlock and P sys- tems without deadlock	103
4.3.3	Relations among P systems with deadlock and differ- ent parallel rewriting modes	110
4.3.4	Deadlock decidability	113
4.4	Remarks and open problems	114
5	Parallel rewriting P systems without target conflicts	117
5.1	Definition	117
5.2	The computational power	121
5.2.1	Parallel P systems with table and maximal parallelism	121
5.2.2	Parallel P systems with unique parallelism	127
5.2.3	Parallel P systems with symbol parallelism	133
5.3	Remarks and open problems	138

6	Hierarchies of parallel rewriting P systems	141
6.1	Krishna–Rama parallel P systems	141
6.2	Parallel rewriting P systems with deadlock	143
6.3	Parallel rewriting P systems without target conflicts	144
6.4	Relations among the three types of parallel P systems	145
6.5	Remarks and open problems	146
II	Bridging Membrane Computing and Biology	147
7	Membrane models of mechanosensitive channels activity	149
7.1	The activity of mechanosensitive channels	151
7.2	Membrane models for mechanosensitive channels activity	153
7.2.1	<i>In vitro</i> model	154
7.2.2	<i>In vivo</i> model	161
7.3	Simulation of subsequent close-to-open cycles	171
7.4	Relations between MscL models and P systems features	173
7.5	Remarks and future extensions	173
	Conclusions and future work	179
A	The cell structure	181
A.1	The biological membrane	181
A.2	Organization of the cell	182
A.2.1	Prokaryotic cells	183
A.2.2	Eukaryotic cells	184
A.3	Transport across cell membranes	186
B	Mechanosensitive channels	191
B.1	Osmosis and turgor pressure	191
B.2	Mechanosensitive channels in <i>Escherichia coli</i>	192
B.3	Patch clamping	193
B.4	Channel open probability	194
B.5	Membrane tension and patch pressure	195
	Bibliography	197
