Contents

1 Introduction 1
1.1 Introduction 1
1.2 The dynamics matters 4
1.3 Molecular computing 9
1.4 Motivations and outline 10

2 P systems 13
2.1 Introduction 13
2.2 The cell: some biology hints 16
2.2.1 Membranes: composition and functioning 17
2.2.2 Organelles of eukaryotic cells 20
2.3 P systems 25
2.3.1 P systems roots 26
2.3.2 Transition P systems 31
2.3.3 Evolution/communication P systems 38
2.3.4 P systems with Active Membranes 39
2.3.5 Some extensions 40
2.3.6 Different organisations of P systems 44
2.4 P systems as computing devices: universality and efficiency . 48
2.5 Implementing P systems: software and hardware solutions . . 49
2.6 P systems as a modelling framework 52
2.6.1 PB systems 56
2.7 Summary 57

3 Symbolic methods for systems dynamics 59
3.1 Computational Systems Biology 59
3.2 Deterministic Mass Action models 64
3.3 Stochastic models 69
3.3.1 Gillespie algorithm 73

3.3.2 Gibson-Bruck algorithm 79
3.3.3 τ leap algorithm 81
3.4 Hybrid systems 84
3.4.1 Stochastic-deterministic hybrid models 85
3.4.2 Discrete-continuous hybrid models 87
3.5 Summary 88

4 Metabolic Algorithm and simulation framework 91
4.1 The metabolic algorithm 91
4.1.1 Metabolic algorithm: an initial version 92
4.1.2 Metabolic algorithm with time-varying reaction maps 99
4.1.3 Some considerations 108
4.1.4 An extended framework for the Metabolic Algorithm . 109
4.1.5 A hybrid formulation 114
4.2 Representing the input: MP Graphs 119
4.3 Representing an oscillatory output: beats decomposition . . . 126
4.4 Summary 131

5 Case Studies 135
5.1 Importance of oscillations in biological systems 136
5.2 A simple oscillator 139
5.3 The predator-prey model 142
5.4 Belousov-Zhabotinsky reaction 149
5.4.1 Single compartment Brusselator 151
5.4.2 Multi-compartment Brusselator 158
5.5 Michaelis-Menten enzymatic reaction 163
5.6 Protein kinase C activation 166
5.7 Circadian rhythms in Drosophila 170
5.8 Mitotic oscillations in amphibian embryos 178
5.9 Summary 189

6 Conclusions 191
